2	April, 2015	Information update
3	August, 2016	Information update
4	March, 2017	Information update

# Purpose

## Purpose

This document provides a listing of the parameters provided in the reference protocols contained under the GE tab selector. The protocols in Adult are based on parameters needed to scan an average sized adult and take the clinical aim of the protocol into consideration. The protocols in Pediatric are based on age in the Head and Orbit area, and in the rest of the body, use Color Coding for Kids or the Feather Light patient sizing scheme. These protocols are designed as a starting point. They should be reviewed with your Radiologist, Physicist, and Radiation Safety Officer and revised as needed to meet the clinical needs of your department. The document is divided into protocol categories available on the system. Each table lists the Protocol Number, Protocol Name, Post Processing software associated with, Scan Type, SFOV, Pitch/Table Speed/Row, Gantry Rotation Time, Slice Thickness, Beam Collimation, kV, mA/AVG mA/Min-Max mA/Noise Index, CTDIvol, Recon Algorithm Type used, Scan Length, DLP (mGy-cm) and Phantom type used.

If the ASiR option is installed on the system, then there will be a % ASiR column listed in the table indicating the ASiR value in the reference protocol.

Manual mA mode allows you to scan without enabling AutomA mode. When building protocols, make sure the mA value field contains a reasonable mA value in the event that AutomA is turned off. In the GE reference protocols, the Average (Avg) mA provided in the tables within this document are what is used in calculating the CTDI and DLP for protocols using AutomA or SmartmA. The Avg mA value provided in the table is an estimate based on an average patient size (32- 36 cm). The actual average mA for each image is calculated by using all of the mA values for each scan rotation, as determined by AutomA for the patient. The AutomA Theory section in the Learning and Reference Guide, Building Protocols Chapter and in the Technical Reference Manual, General Information Chapter details how AutomA does this calculation.

Only protocols 25.34 is appropriate for Radiation Treatment Planning.

# **Optima CT540**

# Head

**Table 2-1 Optima CT540**

Protocol Number	GE Protocol Name	Post Process	Scan Type	SFOV	Pitch Table Speed Row	Rotation Time (Seconds)	Thickness (mm)	Beam Collimation (mm)	kV	mA Min-Max, NI Avg mA	Recon Type	CTDlvol (mGy) w/o ASiR	DLP (mGy-cm) w/o ASiR	Scan Length (mm)	Phantom (cm)	Description

36.7.1	Abd 22.5-31.5kg (49.6-69.5lbs)		Helical	Large	1.375 27.5	0.50	5	20.00	120	85DR	Std	SS40: Slice	2.74	50.65	150.00	Body 32	Weight and height based routine abdominal protocol.
36.8.1	Abd 31.5-40.5kg (69.5-89.3lbs)		Helical	Large	1.375 27.5	0.50	5	20.00	120	90DR	Std	SS40: Slice	2.90	53.63	150.00	Body 32	Weight and height based routine abdominal protocol.
36.9.1	Abd 40.5-55.0kg(89.3-121.3lbs)		Helical	Large	1.375 27.5	0.5	5	20.00	120	95DR	Std	SS40: Slice	3.06	71.90	200.00	Body 32	Weight and height based routine abdominal protocol.

# **Lexicon**

# Lexicon

For the CT technologist who operates multiple scanner models, perhaps from multiple manufacturers, the variability in names for important scan acquisition and reconstruction parameters can lead to confusion, reduced comfort and an increased potential for error. The intent of this CT terminology lexicon is to allow users to translate important CT acquisition and reconstruction terms between different manufacturers' systems.

The following tables provide the SABMI (Scout Adjusted Body Mass Index) terminology for GE and is a result of the AAPM CT Terminology working group. It identifies relevant terms from established lexicon (e.g., Radlex and DICOM) and other relevant literature published.

The AAPM website will provide updates when changes in standardization of terminology occur. Visit [www.aapm.org](http://www.aapm.org), search CT Protocols, and select Lexicon for full listing of terminology across various manufacturers of CT equipment.

The generic descriptions or terms in the first column are intended to orient the user to the relevant concepts; they are not consensus "preferred terms." The generic descriptions are not based on any single existing or pending terminology standard; however the references cited below were consulted in developing the generic descriptions.

A number of individuals and groups have advocated for terminology standardization in CT, including at a March 30-31, 2010 FDA public meeting entitled "Device Improvements to Reduce Unnecessary Radiation Exposure from Medical Imaging" (transcripts available at the FDA website: [www.fda.gov](http://www.fda.gov) in Medical Devices). Participants proposed a cooperative effort among professional organizations (AAPM, ASRT, ACR, etc.), industry, and the FDA.

## Scan Acquisition and User Interface Basics

**Table A-1** Scan acquisition and user interface terms

Generic Description	GE Name
The portion of the <b>user interface</b> where scans are prescribed	Exam Rx
Other portions of the <b>user interface</b> , such as where reconstructed images are viewed	Desktop
<b>CT localizer radiograph</b> (i.e. the scanned projection radiograph, often acquired by the CT system to allow the user to prescribe the start and end locations of the scan range)	Scout
<b>Axial scan mode:</b> Data acquisition while the patient table remains stationary; the table position may be incremented between X-ray exposures to collect data over a longer z axis range.	Axial
<b>Helical or Spiral scan mode:</b> Data acquisition while the patient table is continuously moving along the z axis.	Helical
<b>Dynamic scan mode - single detector width:</b> Data acquisition at multiple time points over the same anatomic location(s) while the patient table remains stationary; X-ray exposure can be continuous or intermittent	Cine or zero interval Axial
Interventional CT - Intermittent X-ray exposures	SmartStep
<b>Interventional CT - Continuous X-ray exposures</b>	SmartView
<b>Table increment</b> (mm) per 360 degree rotation of the X-ray tube (axial scan mode)	Interval
<b>Table feed</b> per 360 degree rotation of the X-ray tube (helical scan mode)	Speed (mm/rot)
<b>Field of measurement:</b> Diameter of the circular region within the scan plane over which projection data are collected. Nominally equal to the diameter of the primary beam at isocenter in the axial plane.	Scan Field of View (SFOV, cm)

Generic Description	GE Name
<b>Tube current:</b> Number of electrons accelerated across an X-ray tube per unit time, expressed in units of milliampere (mA)	mA
<b>Tube potential:</b> The electric potential applied across an X-ray tube to accelerate electrons towards a target material, expressed in units of kilovolts (kV)	kV
<b>Pitch:</b> Unitless parameter used to describe the table travel during helical CT; equal to table travel (mm) per gantry rotation ÷ total nominal beam width (mm)	Pitch
Automated patient instructions	AutoVoice

## Dose Modulation and Reduction Tools

**Table A-2** Dose modulation and reduction tool terms

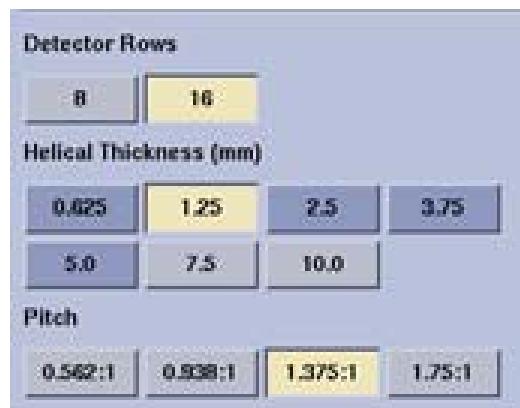

Generic Description	GE Name
<b>Automatic exposure control (AEC):</b> A scanner feature that automatically adapts the X-ray tube current to the overall patient size to achieve a specified level of image quality	Available in AutomA and SmartmA
Longitudinal tube current modulation	AutomA
<b>Angular and longitudinal tube current modulation</b>	SmartmA (x, y, z)
ECG-based tube current modulation	ECG Modulated mA
<b>Image quality reference parameter for AEC</b>	Noise Index

## Multi-slice Detector Geometry

**Table A-3** Multi-slice detector geometry terms

Generic Description	GE Name
Multi-slice detector array design	Fixed
Detector configuration	Detector Configuration

**Figure A-1** Detector Coverage and Slice Thickness - Detector rows (N) and slice thickness (T) selection console screen image

## Image Reconstruction and Display

**Table A-4** Image reconstruction and display terms

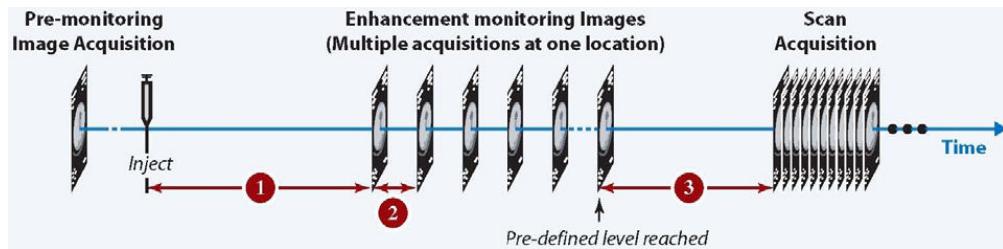

Generic Description	GE Name
<b>Window width:</b> Range of CT numbers (maximum - minimum) that are distributed over the viewable grey scale of the display device or film	Window Width
<b>Window center:</b> The CT number in the center of the viewable grey scale	Window Level
<b>Reconstruction field of view:</b> Width of the square region mapped to the reconstructed image matrix	Display Field of View (DFOV) (cm)
Prescribing the reconstruction parameters prior to scan acquisition	Prospective recon
Prescribing the reconstruction parameters after scan acquisition	Retrospective recon
Reconstruction property that determines sharpness or smoothness of image in the axial plane	Algorithm
Helical interpolation options to achieve a wider or narrower section sensitivity profile	Full (narrower) or Plus (wider) mode
Nominal width of reconstructed image along the z axis	Thickness (mm)
Distance between two consecutive reconstructed images	Interval
Off-center reconstruction coordinates are called	RL Center AP Center
Flip or rotate the image orientation is called	Flip/rotate
Image modifications to alter sharpness or smoothness (done in image space without reconstructing images)	Image Filters

## Contrast Media Tools

**Table A-5** Contrast media tool terms

Generic Description	GE Name
<b>Bolus tracking:</b> Scanner feature to automatically initiate a prescribed axial, helical or dynamic scan when a threshold level of contrast enhancement is reached at a specified region of interest	Smart Prep
<b>Test Bolus:</b> Scan mode used to measure the contrast transit time using a small injection of contrast media	Take axial scans at zero table feed and process with MIROI
<b>Time-attenuation curve (TAC):</b> Graph of the contrast enhancement versus time	Smart Prep graph or MIROI graph
<b>Threshold:</b> CT number (HU) where bolus tracking tool will trigger the system to begin the scan	Transition ROI Threshold
Scanner feature used to quantitatively evaluate the TAC	MIROI (multiple image region of interest)
<b>Monitoring delay:</b> Time from injection to the start of monitoring scans (Time 1 in figure below)	Monitoring Delay
<b>Monitoring interval:</b> Time between consecutive monitoring scans to (Time 2 in figure below)	Monitor ISD (InterScan Delay)
<b>Scan delay:</b> Time from when threshold is reached and prescribed axial, helical or dynamic scan begins (Time 3 in figure below)	Diagnostic delay

**Figure A-2**

## Multi-planar Formats and 3D Processing

**Table A-6** Multi-planar formats and 3D processing terms

Generic Description	GE Name
Reformatted image at an oblique plane (not an axial, coronal, or sagittal)	Oblique reformat
Saving images at various viewing angles about a volume or surface rendered object	Batch Loop
Saving images at various planes through a volume	Batch Reformat
Surface-rendered object	3D
Volume-rendered object	Volume Rendered image (VR)

## Service and Application Tools

**Table A-7** Service and application tool terms

Generic Description	GE Name
X-ray tube warm up	Tube Warm-up (tube warm up)
Daily calibrations	Fast Cals (done in daily prep)
Application information	Learning Solutions or User Manual
Application support assistance	Insite or Ilineq

## Workflow

**Table A-8** Workflow terms

Generic Description	GE Name
Scheduled (but not yet scanned) patient list is called	Patient Schedule
Already scanned patient list is called	List>Select
User comments or text added to an image is called	User annotation
Filming tools are called	Auto/manual film composer
Data page summarizing scan parameters, CTDIvol and DLP	Exam Text Page or Series Text Page
Sorting patient list	Sort
